

# SiteRunner

## NTS System and Network Management

SiteRunner is a real-time software application from Trident Micro Systems that monitors an NTS System or an entire NTS Network from a remote location. SiteRunner is a compliment to NTS Network Commander which provides a view of the network but does not enable configuration management. SiteRunner provides visual status of the entire network and reports all alarm conditions. The visual display gives an indication of the status of each site and connections by color. Clicking on any part of the network reveals more detailed information.

### Features:

- Real Time Network Control
- Major and Minor Alarm Notification
- T1 Monitoring and Alarm
- Back-Up Channel Alarm
- ATB Monitoring & Reporting
- Active Network Status Display
- GUI Application
- Change of State Indicated by Color
- Access From Anywhere in the World
